

Steps to Migrate your WordPress Website to HTTPS

1. Set up SSL certificate
2. Change http to https in General settings (Home URL and SiteURL)
3. Add this to .HTACCESS at the top:

```
RewriteEngine On
RewriteCond %{HTTPS} !=on
RewriteRule ^ https://%{HTTP_HOST}%{REQUEST_URI} [L,R=301]
```

4. Add this to wp-config.php:
define('FORCE_SSL_ADMIN', true);
5. Change Cloudflare/Sucuri or other CDN SSL to 'Full/Strict' (if applicable)
6. Update any links in Robots.txt
7. Check Statcounter or Tracking code snippets
8. Remove and re-add the site in Google Webmaster Tools
9. Run BackupBuddy > Server tools > Database > Text change to change
http://www.siteurl.com to https://www.siteurl.com
10. Log out and log in again to make sure https in General Settings has been saved
11. Check each page on front of site for consistent and full https (full green padlock). If not full https view source and identify http links to correct. (Any images or items that are served from domains that are not on HTTPS will generate a warning)

That's all folks..!
